

# CELLULAR NETWORK DIMENSIONING

2014-12-03

Amirhossein Ghanbari

amigha@kth.se

## Agenda

- Major things to consider
- Capacity demand
- Coverage
  - ▣ Frequency reuse
- Capacity
  - ▣ Cell splitting
  - ▣ Cell sectoring
- Conclusion

## Major things to consider

- 1- coverage
- 2- capacity
- 3- backhaul and core network

Coverage; the area that UEs should be able to connect and stay connected

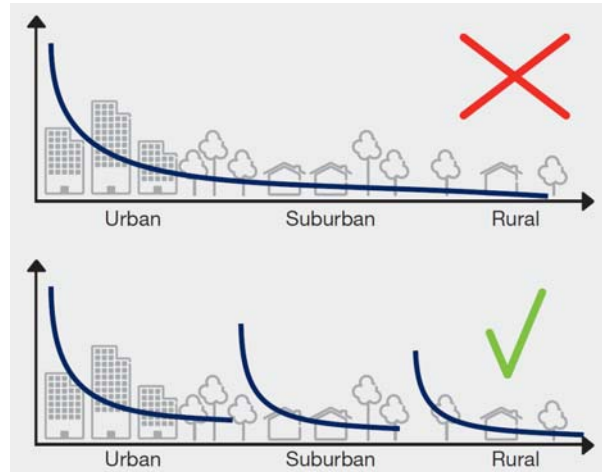

Capacity; cellular networks are dimensioned based on max data rate

## Capacity demand

Source: Ericsson review 2014

## Capacity demand

## Coverage

### Compare Spectral efficiency for cellular systems

Markenčič, Mikuláš Milčević COST-TERRA meeting, Brussels

June 21, 2011

# Coverage

(a) Square pattern

(b) Hexagonal pattern

Source: William Stallings

# Coverage

(a) Cell radius = 1.6 km

(b) Cell radius = 0.8 km

Source: William Stallings

## Coverage

- Area divided into cells
  - ▣ Each with own antenna
  - ▣ Each with own range of frequencies
  - ▣ Served by base station
    - Transmitter, receiver, control unit
  - ▣ Adjacent cells should be on different frequencies to avoid crosstalk

## Frequency Reuse

- Power of base transceiver controlled
  - ▣ Allow communications within cell on given frequency
  - ▣ Limit escaping power to adjacent cells
  - ▣ Allow re-use of frequencies in nearby cells
  - ▣ Use same frequency for multiple conversations
  - ▣ 10 – 50 frequencies per cell
- *E.g.*
  - ▣  $N$  cells all using same number of frequencies
  - ▣  $K$  total number of frequencies used in systems
  - ▣ Each cell has  $K/N$  frequencies
  - ▣ Advanced Mobile Phone Service (AMPS)  $K=395$ ,  $N=7$  giving 57 frequencies per cell on average

## Characterizing Frequency Reuse

- $D$  = minimum distance between centers of cells that use the same band of frequencies (called co-channels)
- $R$  = radius of a cell
- $d$  = distance between centers of adjacent cells ( $d = R$ )
- $N$  = number of cells in repetitious pattern
  - Reuse factor
  - Each cell in pattern uses unique band of frequencies
- Hexagonal cell pattern, following values of  $N$  possible
  - $N = I^2 + J^2 + (I \times J)$ ,  $I, J = 0, 1, 2, 3, \dots$
- Possible values of  $N$  are 1, 3, 4, 7, 9, 12, 13, 16, 19, 21, ...
- $D/R = \sqrt{3N}$
- $D/d = \sqrt{N}$

## Frequency Reuse Patterns

(a) Frequency reuse pattern for  $N = 4$

(b) Frequency reuse pattern for  $N = 7$

Source: William Stallings

## Is that it?

- What about the capacity !!!
- Bottom up calculation (coverage oriented)
  - ▣  $C_{SS} = B * N_s * Eff_s$  **BANDWIDTH**
- Top down calculation (demand oriented)

## Capacity

- Add new channels
  - ▣ The addition of sectors and carriers increase network capacity by adding more radio frequency channels.
- Frequency borrowing
  - ▣ Taken from adjacent cells by congested cells
  - ▣ Or assign frequencies dynamically

## Cell Splitting

- The unit area of RF coverage for cellular network is called a *cell*.
- In each cell, a *base station* transmits from a fixed *cell site* location, which is often centrally located in the cell.
- In base stations where the usage of cellular network is high, these cells are split into smaller cells.

## Cell splitting

Source: William Stallings

## Cell Splitting (con't)

- The radio frequencies are reassigned, and transmission power is reduced.
- A new cell site must be constructed when a cell is split
- Cell splitting is one of the easy and less costly solution when increasing the capacity of cellular network.
- Splitting the cells into smaller ones also lead to a new solution called cell sectoring.

## Cell Sectoring

- Sectorization consists of dividing an *omnidirectional* (360 degree) view from the cell site into non-overlapping slices called *sectors*.
- When combined, sectors provide the same coverage but they are considered to be separate cells.
- Also considered as one of easy and inexpensive capacity increasing solution.

## Cell Sectoring

- In basic form, antennas are omnidirectional
- Replacing a single omni-directional antenna at base station with several directional antennas, each radiating within a specified sector.
- achieves capacity improvement by essentially rescaling the system.
- less co-channel interference, number of cells in a cluster can be reduced
- Larger frequency reuse factor, larger capacity

## Cell Sectoring

- Cell Sectoring
  - ▣ Cell divided into wedge shaped sectors
  - ▣ 3 – 6 sectors per cell
  - ▣ Each with own channel set
    - Subsets of cell's channels
  - ▣ Directional antennas

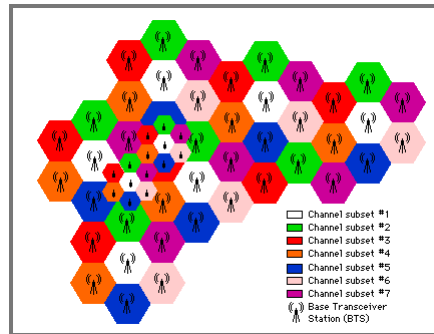

## Cell sectoring

## Cell sectoring – addition of carriers

## Conclusion
