WebSocket

# Event Listeners

- ▶ The JavaScript function `addEventListener()` attaches an event listener to the specified element.

```
<button id="myBtn">Try it</button>
<p id="demo"></p>
```

```
document.getElementById("myBtn") .
    addEventListener("click", displayDate);

function displayDate() {
    document.getElementById("demo") .
        innerHTML = Date();
}
```

- ▶ **Multiple** event listeners, even of the same type, can be attached to the same element.

DOM

BOM

jQuery

X

jQuery

Long Polling

WebSocket

# Event Listeners

- ▶ The JavaScript function `addEventListener()` attaches an event listener to the specified element.

```
<button id="myBtn">Try it</button>
<p id="demo"></p>
```

```
document.getElementById("myBtn") .
    addEventListener("click", displayDate);

function displayDate() {
    document.getElementById("demo") .
        innerHTML = Date();
}
```

- ▶ **Multiple** event listeners, even of the same type, can be attached to the same element.
- ▶ **Event listeners** is preferred over **onEvent** attributes since it separates JavaScript from HTML, thereby increasing **cohesion**.

# Question 1

# Event Bubbling

- ▶ When an element fires an event, also the event handlers of its **parents** are invoked.

[DOM](#)[BOM](#)[jQuery](#)[AJAX](#)[Knockout](#)[Long Polling](#)[WebSocket](#)

# Event Bubbling

- ▶ When an element fires an event, also the event handlers of its **parents** are invoked.
- ▶ An event first triggers the **deepest** possible element, **then its parents** in nesting order.

[DOM](#)[BOM](#)[jQuery](#)[AJAX](#)[Knockout](#)[Long Polling](#)[WebSocket](#)

# Event Bubbling Example

## ▶ HTML:

```
<div onclick="show(1)">1
  <div onclick="show(2)">2
    <div onclick="show(3)">3
      <p id="event-log"></p>
    </div>
  </div>
</div>
```

## JavaScript:

```
function show(sourceNo) {
  var curr = document.
    getElementById("event-log").innerHTML;
  document.getElementById("event-log").
    innerHTML = curr + " " + sourceNo;
}
```

DOM

BOM

jQuery

AJAX

Knockout

Long Polling

WebSocket

# Event Bubbling Example

## ▶ HTML:

```
<div onclick="show(1)">1
  <div onclick="show(2)">2
    <div onclick="show(3)">3
      <p id="event-log"></p>
    </div>
  </div>
</div>
```

## JavaScript:

```
function show(sourceNo) {
  var curr = document.
    getElementById("event-log").innerHTML;
  document.getElementById("event-log").
    innerHTML = curr + " " + sourceNo;
}
```

- ▶ When clicking the **innermost** div (number 3), the output is **3 2 1**

DOM

BOM

jQuery

- ▶ The jQuery object supports **array subscripting** via brackets:

```
$("h1")[0]; //The first h1 element.
```

- ▶ The jQuery object also has **utility methods** that are not related to a HTML element:

```
// Returns the string "extra whitespace"  
$.trim( "  extra whitespace  " );
```

# Event Handlers

- ▶ In jQuery, an event handling function is passed as **argument to a method with the event name** in the jQuery object wrapping the desired event source.

[DOM](#)[BOM](#)[jQuery](#)[AJAX](#)[Knockout](#)[Long Polling](#)[WebSocket](#)

# Event Handlers

- ▶ In jQuery, an event handling function is passed as **argument to a method with the event name** in the jQuery object wrapping the desired event source.
- ▶ The following code adds an event handler to all **<p>** elements. The event handler will change the paragraph's text to **You clicked!** when the user clicks it.

```
$( "p" ).click( function () {  
    $( this ).html ( "You clicked" );  
} );
```

```
class SomeClass implements \JsonSerializable {
    private $some_var;
    ...
    public function jsonSerialize() {
        $json_obj = new stdClass;
        $json_obj->someVar = $this->some_var;
        ...
        return $json_obj;
    }
}
```

- ▶ The object that shall be JSON encoded must be of a class that **implements `JsonSerializable`**.
- ▶ That class must have a **method** called **`jsonSerialize`**, which **returns an object** containing all relevant fields.
- ▶ That returned object must be **possible to encode** with **`json_encode`**.

# Long Polling JavaScript Client

```
$(document).ready(function () {  
    function fetchFromServer () {  
        $.getJSON("get-msg.php",  
            function (response) {  
                $("#fromServer").  
                    prepend("<p>" + response +  
                        "</p>");  
                fetchFromServer ();  
            });  
    }  
  
    fetchFromServer ();  
});
```

Long polling is achieved by the call to **fetchFromServer** in red. This way a new call is made as soon a response has been handled.

# A Word of Warning

- ▶ The server will not handle multiple simultaneous requests in the same session. If one request is being handled, **other requests in the same session are blocked**.
- ▶ Therefore, if the server has started a session, it is best to **stop the session before calling `sleep`**.

```
\session_write_close();  
\sleep(self::ONE_SEC);  
\session_start();
```

**`session_write_close`** saves session data and closes the session. This is what happens every time a response has been sent, if a session was started.
