

Models for Wireless Infrastructure economics & Mobile Broadband deployment

Jens Zander

Wireless@KTH

1

Outline

- Some fundamental problems in infrastructure provisioning
- Wireless Network design fundamentals
- Wireless Broadband dimensioning & deployment models

Wireless@KTH

2

Some fundamental questions

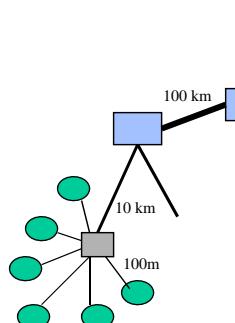

Wireless@KTH

3

The "last mile" problem: Most investments in Access Networks

- Backbone network shared by many
- Access network individual

Example: 2 cities 50.000 user each

Access network: 100 m/user

Trunk network: 1 m/user (=100 km/100.000 users)

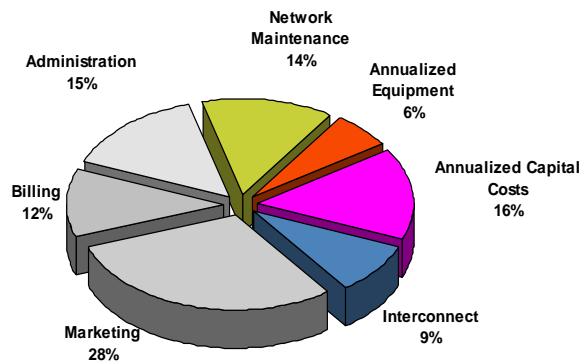

Wireless@KTH

4

Wireless operator costs

Wireless@KTH 5

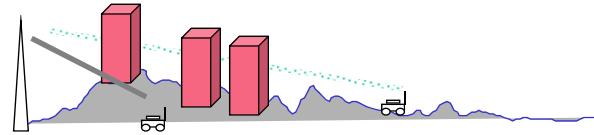

Wireless Network Dimensioning - a recap

Wireless@KTH 6

Wireless Networks - problems

- Range
- Coverage

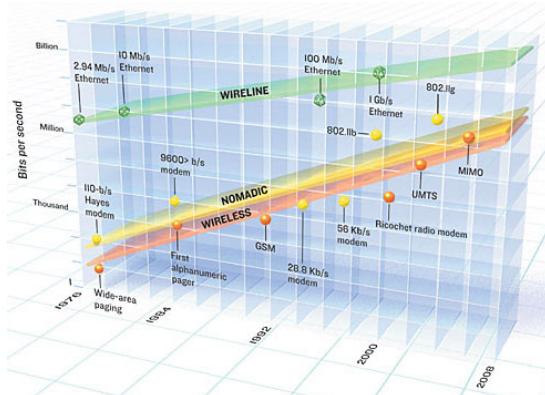

$$\frac{E_{rx}}{N_0} \propto \frac{P_{tx} G_{ant}}{B_{user} R^\alpha} \geq \gamma_0(\eta_{eff})$$

7
Wireless@KTH Center for Wireless Systems

Peak rates & PHY-technology is no longer THE issue ..

“Edholms law”

8
Wireless@KTH Center for Wireless Systems

Range limitations

- Typical ranges (NLOS):

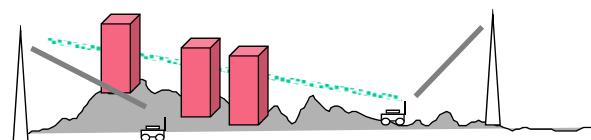

- 10 kbit/s (GSM) 25+ km
- 500 kbit/s (EDGE) 5-10 km
- 2 Mbit/s (UMTS/) 2-3 km
- 10 Mbit/s (HSPA) 500 m
- 100 Mbit/s (LTE/WLAN) 50-150 m

$$N_{BS} = \frac{A_{tot}}{A_{cell}} \propto \frac{1}{R^2} = \left(\frac{B_{user}}{G_{ant} P_{tx}} \right)^{2/\alpha}$$

Wireless@KTH

Wireless Networks - problems cont.

- Interference due to spectrum reuse
- Capacity limitation

Wireless@KTH

The infrastructure cost

$$C_{\text{infra}} = c_1 + c_{BS} N_{AP} \approx c_{BS} N_{AP}$$

- Spectrum limitation
 - B_{tot} available bandwidth
 - Spectral /reuse efficiency K

$$C_{\text{infra}} \approx c_{BS} \frac{B_{\text{tot}}}{\eta W_{\text{sys}}} = c_{BS} \frac{N_{\text{user}} B_{\text{user}}}{\eta W_{\text{sys}}} = c_{BS} \frac{\omega_{\text{user}} A_{\text{tot}} B_{\text{user}}}{\eta W_{\text{sys}}}$$

- Coverage limitation

$$N_{BS} \propto \frac{1}{R_{\text{cell}}^2} \propto \left(\frac{\gamma_0 N}{P} \right)^{2/\alpha} \propto B_{\text{user}}^{2/\alpha}$$

Mobile Data Tsunami

VoIP traffic forecasted to be 0.4% of all mobile data traffic in 2015.
Source: Cisco VNI Mobile, 2011

Cisco forecast: 2015 – 26x
Extrapolation: 2020 - 1000x

Wireless@KTH Center for Wireless
Systems

Lowering the system cost

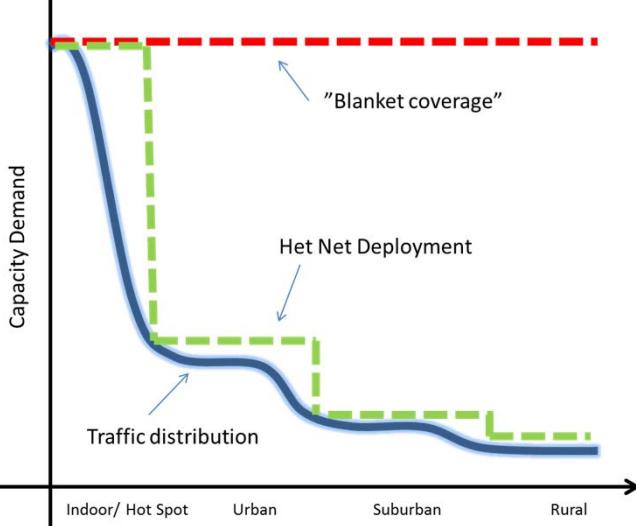

$$C_{sys} \approx c_2 \frac{B_{tot}}{\eta W_{sys}} + c_3 W_{sys} = c_2 \frac{\omega A_{tot} B_{user}}{\eta W_{sys}} + c_3 W_{sys}$$

- Improving the efficiency of the modulation and RRM system, i.e. increasing η
- Reducing the coverage area A_{tot} . The required data rate is only provided in parts of the area
- Buying more spectrum ?
- Reducing the cost per base station

$$c_2 = C_{AP} = C_{site} + C_{backhaul} + C_{equipment} + C_{deployment} + C_{maint}$$

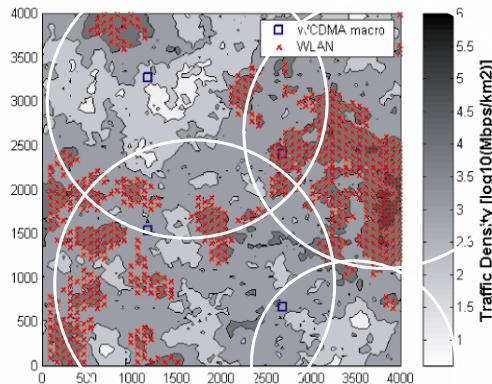

Partial coverage

"HET NETS" – from "blanket coverage" to selective capacity

(Klas Johansson, "Cost Effective Deployment Strategies for Heterogeneous Wireless Networks", Doctoral Thesis, KTH 2007)

Wireless@KTH

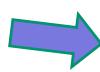

15

Technology shift

- Industry grade eq
- High power
- 24-7 availability
- High **system** complexity

- Consumer grade eq
- Low power/Short range
- Low **system** complexity (P&P, SON)
- Massive deployment
- Reliability through redundancy

16

The cost of spectrum

$$C_{sys} \approx c_{BS} N_{BS} = c_{BS} \frac{B_{tot}}{\eta W_{sys}}$$

$$B_{tot} \approx \frac{C_{sys}}{c_{BS}} \eta W_{sys} = \eta N_{BS} W_{sys}$$

$$B_{tot} + \Delta B \approx \eta N_{BS} W_{sys} + \eta \Delta N W_{sys} + \eta N_{BS} \Delta W$$

More base stations More spectrum

$$C_{sys} + \Delta C \approx C_{sys} + c_{BS} \Delta N + (\Delta c_{BS} N_{BS} + c_{sp}) \Delta W$$

$$\min \Delta C = \min \left(c_{BS} \frac{\Delta B}{\eta W_{sys}}, (\Delta c_{BS} N_{BS} + c_{sp}) \frac{\Delta B}{\eta N_{BS}} \right)$$

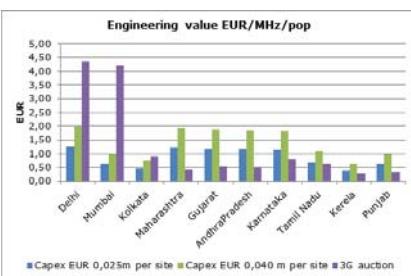

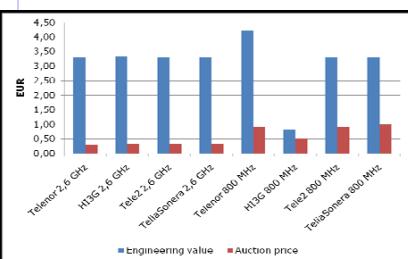

$$c_{sp}^* = \frac{c_{BS}}{W_{sys}} - \Delta c_{BS} N_{BS}$$

Engineering value of spectrum

Wireless@KTH

Is mobile spectrum still "cheap"?

Mobile broadband deployment

Wireless@KTH

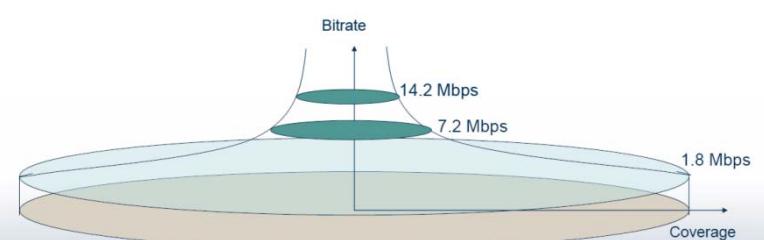

19

Coverage & Bit rate

Coverage vs. bitrate

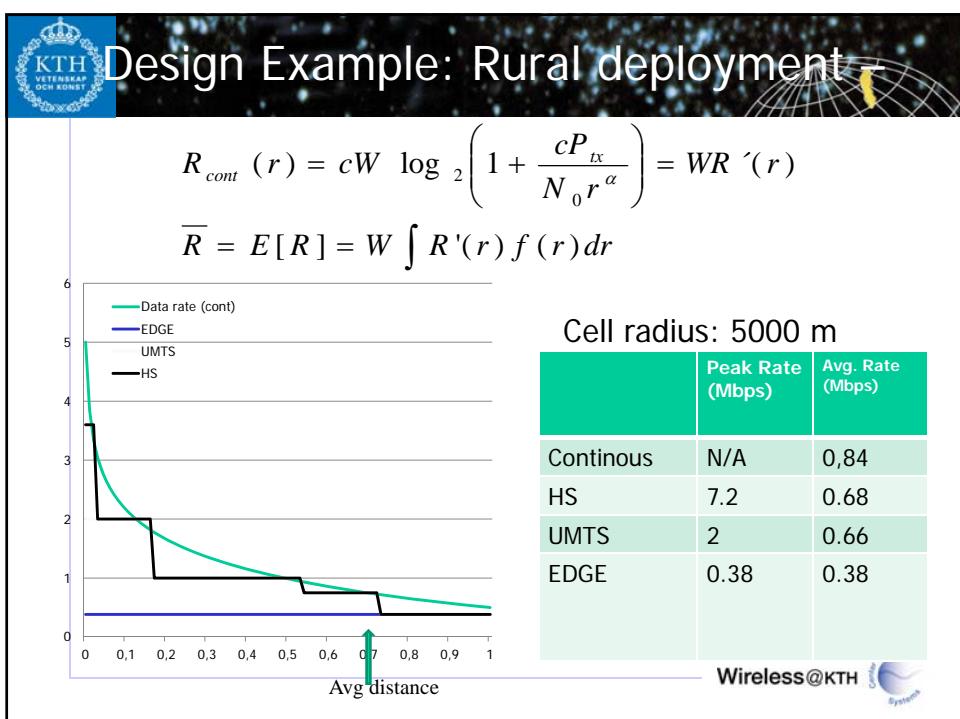

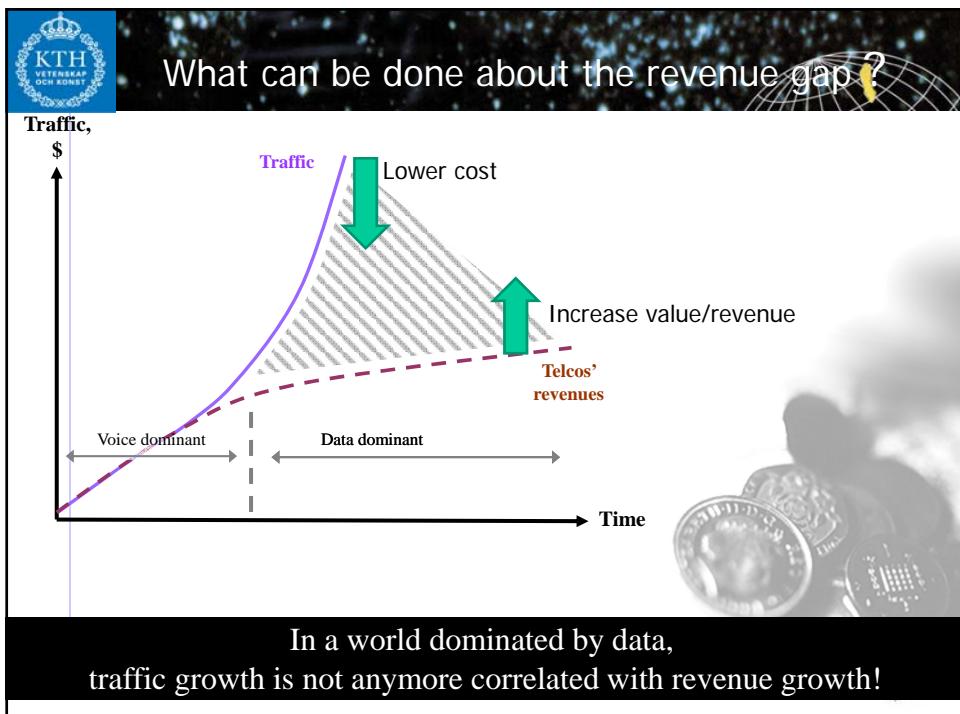

Double peak rate does not correspond to double capacity

ERICSSON

Wireless@KTH

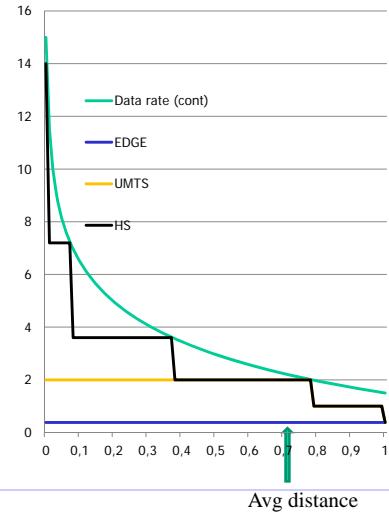

20

Design Example: Urban deployment

Cell radius: 1500 m

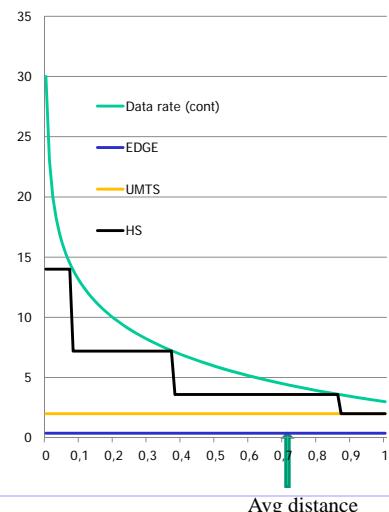

| | Peak Rate (Mbps) | Avg. Rate (Mbps) |
|-----------|------------------|------------------|
| Continous | N/A | 2,5 |
| HS | 7.2 | 1,9 |
| UMTS | 2 | 1,6 |
| EDGE | 0.38 | 0.38 |

Wireless@KTH

Design Example: Very dense deployment

Cell radius: <500 m

| | Peak Rate (Mbps) | Avg. Rate (Mbps) |
|-----------|------------------|------------------|
| Continous | N/A | 5,1 |
| HS | 7.2 | 3,8 |
| UMTS | 2 | 2 |
| EDGE | 0.38 | 0.38 |

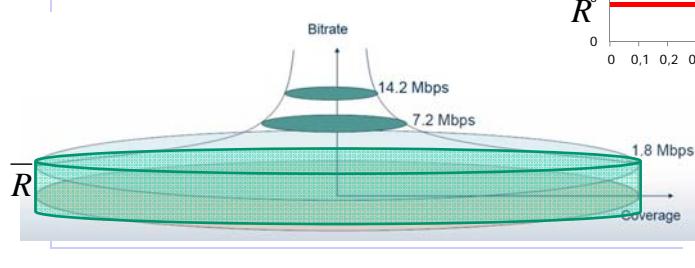

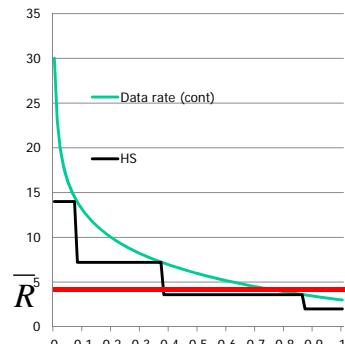

Wireless@KTH

Single cell capacity & approximation

Single cell capacity

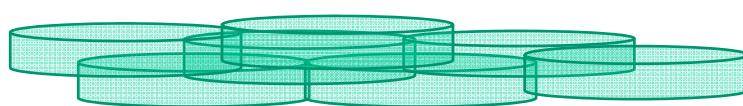

$$\bar{R} = E[R] = W \int R'(r) f(r) dr$$

25 Wireless@KTH Center for Wireless Systems

Deployment strategies

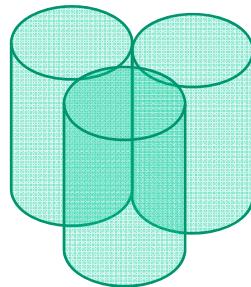

- Wide area "blanket coverage"
- Low Capacity

26 Wireless@KTH Center for Wireless Systems

Deployment strategies

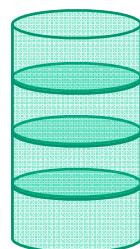

- Limited "Hot spot" coverage
- High capacity Capacity

Wireless@KTH
Centre for Wireless
Systems

27

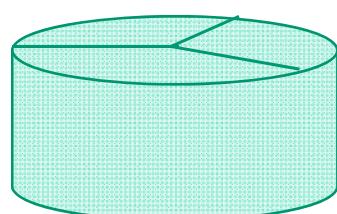

Capacity enhancement

- More spectrum (channels)
- $$\bar{R} = E[R] = \frac{1}{W} \int R(r) f(r) dr$$

$$R_{tot} = N_{ch} \bar{R}$$

- Sectorization
- Improved spatial reuse

$$\bar{R}_{tot} \approx N_s \bar{R}$$

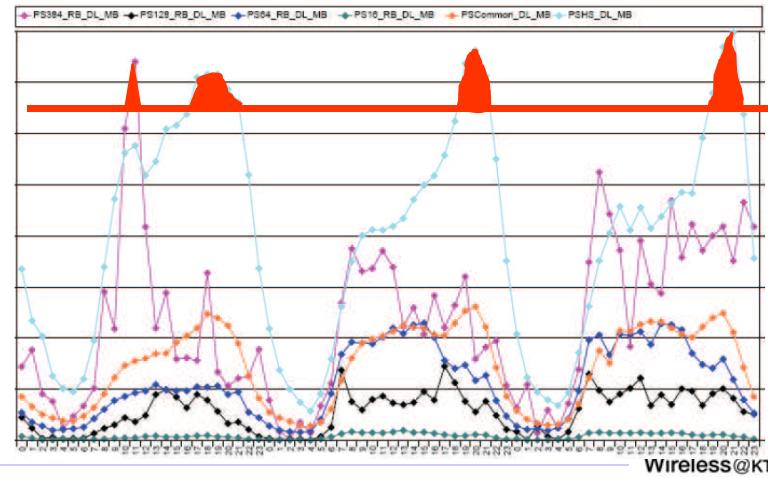

Wireless@KTH
Centre for Wireless
Systems

28

Temporal design – peak capacity

- Networks designed for "peak/busy hour"

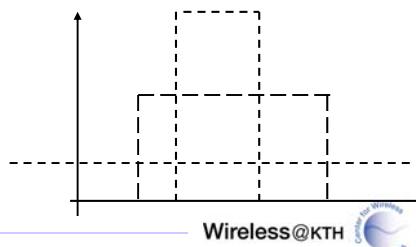

29

Dimensioning

- For voice and RT data you need to estimate the maximum number of ongoing calls or sessions
 - Depends on the arrival rate and the duration of "calls"
 - Is based on the traffic during the "busiest hour"
- For data NRT data traffic the approach with "average data rate" per user can be used
 - X GB per user and month
-> Y kbps per user
 - During 24 hrs all day(s)
 - During 2 - 8 hours per day

Wireless@KTH

Numerical example

- 1 Gbyte/month = 30 Mbyte/day

(= 1.3 Mbyte/h average)

= 4-5 Mbyte/h peak hour (all daily traffic in 6-8h)

= 4800Kbyte/3600 s = 1.5 Kbyte/s = 12 Kbps

Population density: 100 pop/sqkm

Cell size: 1.500 m = 6,8 sqm => 680 pop/cell

Capacity demand: 12 * 680 = 8,5 Mbps /cell

=> 8,5/3 = 2 Mbps/sector

Wireless@KTH
Center for Wireless
Systems

31

Energy constraints

- **Global scale:**

- Energy consumption of IT-technology not neglectable (2% of CO₂-emission)

- 3G technology example

- Base station RF output (at antenna): 60 W
 - Power input: 3-6 kW (Efficiency 1-2%)
 - Reason Spectrum efficient – not power efficient

- **ELECTRICITY BILL**

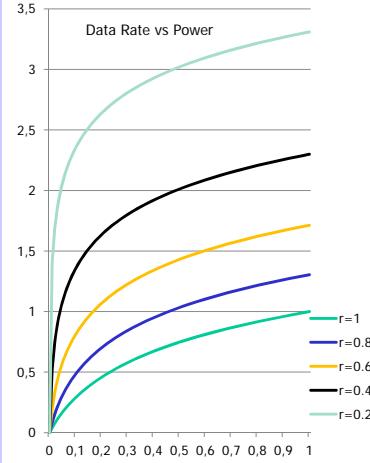

- 30.000 BS = 1 GWh/day = 1 MSEK/day
 - 30 MSEK/month / 1 M Users
 - 30 SEK/month (@1 SEK/KWh)
 - 60 SEK/month (@ 2 SEK/kWh)

Wireless@KTH

Systems

What Power to use ?

$$\begin{aligned}\bar{R} &\approx R(\bar{r}) = cW \log_2 \left(1 + \frac{cP_{tx}}{N_0 \bar{r}^{-\alpha}} \right) = \\ &= cW \log_2 \left(1 + \frac{cP_{tot}}{N_0 \bar{r}^{-\alpha} N_{BS}} \right) = \\ &= cW \log_2 \left(1 + \frac{c' P_{tot}}{N_0 \bar{r}^{-\alpha-2}} \right)\end{aligned}$$

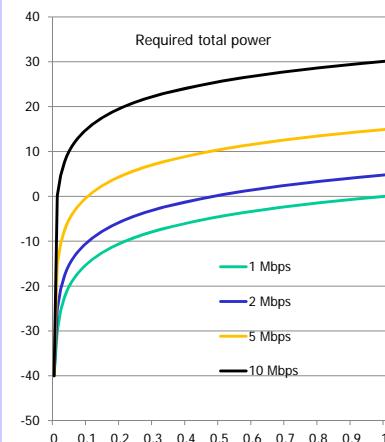

$$N_{BS} \propto \frac{1}{r^2}$$

Wireless@KTH Center for Wireless Systems

33

What cell size to use ?

$$\begin{aligned}\bar{R} &\approx c_0 W \log_2 \left(1 + \frac{c' P_{tot}}{N_0 \bar{r}^{-\alpha-2}} \right) \\ P_{tot} &\approx c_1 \bar{r}^{-\alpha-2} \left(2^{c_0 W} - 1 \right)\end{aligned}$$

Wireless@KTH Center for Wireless Systems

34

Some conclusions

- Peak & average data rates differ a lot
- Cell capacity = Average data for user in cell
- Increase capacity by more channels & Sectors
- Dimensioning for peak-hour traffic
- Total energy consumption decrease with cell size
