Education cycle

Third cycle

Specific prerequisites

Language of instruction

The language of instruction is specified in the course offering information in the course catalogue.

Intended learning outcomes

After the course, the student should be able to:

- describe the general principles for system identification.

- identify systems in a satisfactory manner. This includes choice of excitation signals, model structure and estimation algorithm as well as proper use of model validation.
- analyse basic model properties, such as identifiability and accuracy (bias and variance errors).
- contribute to the research frontier in the area.

Course contents

Signal spectra, linear time-invariant systems, prediction and filtering, particle filtering, linear and non-linear models, identifiability, non-parametric methods, parameter estimation, maximum likelihood estimation, linear regression, least-squares estimation, the prediction error method, the instrumental variable methods, subspace identification, kernel methods, support vector machines, Monte Carlo methods, convergence and consistency, modeling accuracy, Cramér-Rao lower bound, numerical optimization, recursive estimation, bias and variance errors, experiment design, applications oriented system identification, choice of identification criterion, model validation, model structure selection, system identification in practice.

Disposition

Lectures, exercises, presentations on selected topics by the participants, homework problems, 72 h take home exam.

Course literature

Lennart Ljung, System identification: Theory for the user, 2nd ed. Prentice-Hall 1999.

Handouts.

A good complement is:

Torsten Söderström and Petre Stoica. System Identification 1999.

Examination

Based on recommendation from KTH's coordinator for disabilities, the examiner will decide how to adapt an examination for students with documented disability.

The examiner may apply another examination format when re-examining individual students.

If the course is discontinued, students may request to be examined during the following two academic years.

Other requirements for final grade

- 15 min oral presentation of a selected topic in one of the lectures.
- 80 % on weekly home-work problems.
- project (preferable on a problem related to the student's own research).
- 50% on 72h take home exam.

Ethical approach

- All members of a group are responsible for the group's work.
- In any assessment, every student shall honestly disclose any help received and sources used.
- In an oral assessment, every student shall be able to present and answer questions about the entire assignment and solution.
